

Improve Patient and Family Communication About Surgeries

Communicating with patients and their families during the perioperative period can be a lengthy process involving multiple back-and-forth phone calls to discuss preoperative instructions, provide families with intraoperative updates, and check in with the patient after discharge to answer any postoperative questions.

TigerConnect real-time communication and patient engagement features make it easy to communicate with patients and families regarding surgeries, ensuring that everyone stays informed.

Using TigerConnect to communicate with patients and their families during the pre-op, intra-op, and post-op phases saves time for patients and staff.

The ability to message patients helps to improve patient engagement in the pre-op conversation and ensure that patients follow their post-op care plans, as they can refer back to messages and easily reach their provider with questions, reducing readmissions.

Automating the surgical communication process ultimately reduces no-show rates for surgery, improves patient engagement and satisfaction, and gives valuable time back to clinicians.
