

Alarm Management

Reduce alarm fatigue and support timely clinical response by intelligently managing alarms from bedside medical devices, including patient monitors, infusion pumps, and ventilators, so nurses can focus on true priorities instead of constant noise.

Keep Focus on What's Clinically Relevant

TigerConnect Alarm Management is a cloud-native, FDA-cleared solution that ingests alarm and event data from bedside medical devices and intelligently routes context-rich notifications for actionable patient events to the right care team members on any mobile device.

Address Alarm Fatigue Head-On

Context at Your Fingertips

Alerts including key patient context from the EHR are delivered to TigerConnect, Epic, or any third-party messaging app. Auto-escalation passes on any alerts that go unacknowledged – powered by TigerConnect's intelligent workflow orchestration engine, CareConduit.

Easy to Deploy, Maintain, & Scale

Cloud-native architecture eliminates the complexity of traditional on-prem alarm management solutions, enabling rapid deployment, seamless updates, and effortless scalability across units and facilities while keeping total cost of ownership low.

Cut Through the Noise

Configurable, rule-based logic differentiates transient, self-resolving alarms from clinically significant events. Notifications are only triggered when intervention is required, reducing interruptions from nuisance alarms and enabling faster responses to maintain patient safety and quality of care.
