

SMART ROOM SUITE

Digital Whiteboard

Empower patients, families, and care teams with real-time information displayed on a dynamic digital whiteboard.

Eliminate Manual Updates and Outdated Information

The Digital Whiteboard connects to the EHR to receive data in real-time. Patients and families can view or engage with key details through in-room displays or supported devices. Optional integration with real-time locating systems enhances awareness by identifying staff as they enter, completing rounding documentation.

Automate and Modernize Your Whiteboards

Real-Time Accuracy

EHR-driven updates ensure medications, schedules, care team details, safety precautions, and discharge plans are always current.

Interactive Patient Communication

Patients and caregivers can share goals, questions, and preferences through supported devices, enhancing engagement, comfort, and clarity.

Adaptive Information Sharing

Includes touch-enabled functionality to annotate images, draw, and access expanded patient information or radiology images. Address the needs of different patient populations with department-specific views such as Pediatric and NICU.

Versatile Display Options

Patients can bring up a full-screen whiteboard with a single touch or view key information without leaving their TV or movie. The whiteboard can also run as a standalone display separate from the Interactive TV in either vertical or horizontal orientation.

Flexible Configuration

Design layouts and patient-facing content surfaces the most relevant information directly from the EHR. Align the interface with your clinical workflows, branding needs, and population-specific requirements.
